

READ THIS BEFORE USING THE KIT

Check to make sure the resin (part A) is CRYSTAL CLEAR. If it is - go ahead and use. RESIN NOT CLEAR? DO NOT MIX!

Occasionally, resin (part A) can build up crystallization and/or gel, which makes the resin cloudy. Don't worry, there's an easy fix! Heat up the resin to make it clear and liquid again.

- 1.** Put the whole jug into hot water until the resin reaches 50°C or 122°F. You can use other methods of heating as well, as long as they don't melt the container.
- 2.** Allow the product to cool to room temperature before using. The warmer the resin, the shorter the working time.
